Update of “What Is the New Normal Unemployment Rate?”

By John C. Williams

February 10, 2015

This note reports updated estimates of the natural rate of unemployment based on the methods used in “What Is the New Normal Unemployment Rate?” FRBSF Economic Letter 2011-05, February 14, 2011, by Justin Weidner and John C. Williams: http://www.frbsf.org/publications/economics/letter/2011/el2011-05.html. The estimates reported in the original Economic Letter were based on data available in early February 2011. The estimates reported in this note use data through the fourth quarter of 2014. This update also incorporates the estimates of the natural rate of unemployment published by the Congressional Budget Office in January 2015.

Figure 1 is an updated version of Figure 1 from the Economic Letter. The smoothed (four-quarter average) natural rate estimates based on the four alternative labor market indicators range from 5.1% to 6.5% in the fourth quarter of 2014. The median estimate is 5.8%, 1.0 percentage points above the 4.8% pre-recession median estimate. Figure 2 shows the median estimates and range of values implied by the four alternative measures since 1996 using the four-quarter averages. For comparison, the median response to the question about the level of the natural rate of unemployment in the August 2014 Survey of Professional Forecasters (SPF) was 5.5%. The blue line in Figure 2 shows the median SPF natural rate response and the red lines show the 90th and 10th percentile SPF responses in each period.
