# What the Cyclical Response of Advertising Reveals about Markups and other Macroeconomic Wedges 

Robert E. Hall<br>Hoover Institution and Department of Economics Stanford University

Conference in Honor of James Hamilton Federal Reserve Bank of San Francisco

19 September 2014

## Theorem:

Let $R$ be the ratio of advertising expenditure to the value of output. Let $-\epsilon$ be the residual elasticity of demand. Let $m$ be an exogenous multiplicative shift in the profit margin. Then the elasticity of $R$ with respect to $m$ is $\epsilon-1$, which is a really big number.

## PAPERS ON VARIATIONS IN MARKET POWER

- Bils (1987), Nekarda and Ramey (2010, 2011)
- Rotemberg and Woodford (1999)
- Bils and Kahn (2000)
- Chevalier and Scharfstein (1996)
- Edmond and Veldkamp (2009)

## Literature on advertising

- Dorfman and Steiner (1954)
- Bagwell, Handbook of IO (2007), 143 pages!

## Wedges

Profit-margin wedge $m$ raises the markup of price over cost-for example, lowers residual elasticity of demand

## Wedges

Profit-margin wedge $m$ raises the markup of price over cost-for example, lowers residual elasticity of demand

Product-market wedge $f$ raises the purchaser's price relative to the seller's price-for example, a sales tax

## Propositions

The elasticity of the advertising ratio $R$ with respect to the profit-margin wedge $m$ at the point $f=m=1$ is $\epsilon-1$.

## Propositions

The elasticity of the advertising ratio $R$ with respect to the profit-margin wedge $m$ at the point $f=m=1$ is $\epsilon-1$.

The elasticity of the advertising ratio with respect to the product-market wedge $f$ is -1 .

## Propositions

The elasticity of the advertising ratio $R$ with respect to the profit-margin wedge $m$ at the point $f=m=1$ is $\epsilon-1$.

The elasticity of the advertising ratio with respect to the product-market wedge $f$ is -1 .

The elasticity of the labor share $\lambda$ with respect to the profit-margin wedge $m$ is -1 .

## Propositions

The elasticity of the advertising ratio $R$ with respect to the profit-margin wedge $m$ at the point $f=m=1$ is $\epsilon-1$.

The elasticity of the advertising ratio with respect to the product-market wedge $f$ is -1 .

The elasticity of the labor share $\lambda$ with respect to the profit-margin wedge $m$ is -1 .

The elasticity of the labor share with respect to the product-market wedge $f$ is -1 .

## From these propositions,

$$
\log R=(\epsilon-1) \log m-\log f+\mu_{R}
$$

## From these propositions,

$$
\log R=(\epsilon-1) \log m-\log f+\mu_{R}
$$

and

$$
\log \lambda=-\log m-\log f+\mu_{\lambda}
$$

where $\mu^{R}$ and $\mu^{\lambda}$ are constant and slow-moving influences apart from $m$ and $f$.

# SOLVING FOR $\log m$ AND $\log f$ YIELDS 

$$
\log m=\frac{\log R-\log \lambda}{\epsilon}+\mu_{m}
$$

## SOLVING FOR $\log m$ AND $\log f$ YIELDS

$$
\log m=\frac{\log R-\log \lambda}{\epsilon}+\mu_{m}
$$

and

$$
\log f=-\log \lambda-\frac{\log R-\log \lambda}{\epsilon}+\mu_{f}
$$

Here $\mu_{m}$ and $\mu_{f}$ are constant and slow-moving influences derived in the obvious way from $\mu_{R}$ and $\mu_{\lambda}$.

# Advertising is A capital stock 

$$
A_{t}=a_{t}+(1-\delta) A_{t-1}
$$

# Advertising is A capital stock 

$$
\begin{gathered}
A_{t}=a_{t}+(1-\delta) A_{t-1} \\
\kappa_{t}=\frac{r+\delta}{1+r} v_{t} .
\end{gathered}
$$

Advertising spending / Private GDP

## LABOR SHARE

Profit-margin wedge

Product-market wedge

## Periodicity

Periodicity: number of years between one peak and and the next in a cyclical component

## Periodicity

Periodicity: number of years between one peak and and the next in a cyclical component

Periodicity of a component at frequency $\omega$ is $2 \pi / \omega$

## Filtering out higher periodcities

Baxter and King, 1999

## Filtering out higher periodcities

Baxter and King, 1999
Linear filter $\phi(L)$

## Filtering out higher periodcities

Baxter and King, 1999
Linear filter $\phi(L)$
The time series $\hat{x}_{t}=\phi(L) x_{t}$, with adroit choice of $\phi(L)$, can emphasize business-cycle periodicities-ranging from once every two years to once every 5 years-and attenuate higher periodicities

## Filtering out higher periodcities

Baxter and King, 1999
Linear filter $\phi(L)$
The time series $\hat{x}_{t}=\phi(L) x_{t}$, with adroit choice of $\phi(L)$, can emphasize business-cycle periodicities-ranging from once every two years to once every 5 years-and attenuate higher periodicities

Gain applied to a periodicity with frequency $\omega$ is $\left|\phi\left(e^{i \omega}\right)\right|$

## Gain functions for filters that EMPHASIZE CYCLICAL MOVEMENTS

Calculated Filtered Time Series for the Profit-Margin Wedge

Calculated Filtered Time Series for the Product-Market Wedge 0.08
$0.06-1$
$0.04-1$

# REGRESSIONS OF THE FILTERED MARKUP WEDGE ON THE EMPLOYMENT RATE 

| Employment <br> timing | Filter | Coefficient | Standard <br> error | Years | Upper-tail p- <br> value for <br> coefficient $=-0.1$ |

# Role of the two wedges in employment VOLATILITY 

$$
L_{t}=\theta \log m_{t}+\rho \log f_{t}+x_{t}
$$

# Role of the two wedges in employment VOLATILITY 

$$
L_{t}=\theta \log m_{t}+\rho \log f_{t}+x_{t}
$$

Master wedge $=m f \frac{\epsilon}{\epsilon-1}$

# Role of the two wedges in employment VOLATILITY 

$$
L_{t}=\theta \log m_{t}+\rho \log f_{t}+x_{t}
$$

Master wedge $=m f \frac{\epsilon}{\epsilon-1}$
Reasonable to take $\theta=\rho$

# Role of The TWO WEDGES IN EMPLOYMENT VOLATILITY 

$$
L_{t}=\theta \log m_{t}+\rho \log f_{t}+x_{t}
$$

Master wedge $=m f \frac{\epsilon}{\epsilon-1}$
Reasonable to take $\theta=\rho$
From Hall, $J P E, 2009$, I take $\theta=-1$ as the main case, but examine the consequences of lower and higher values

# Contributions of Wedges to <br> Employment Movements as Functions of the Parameter $\theta$ 

## Conclusions about the profit-margin WEDGE

The profit-margin wedge extracted from the advertising/GDP ratio $R$ and the labor share $\lambda$ has low volatility and no apparent cyclical movements

## Conclusions about the profit-margin WEDGE

The profit-margin wedge extracted from the advertising/GDP ratio $R$ and the labor share $\lambda$ has low volatility and no apparent cyclical movements

The wedge is close to uncorrelated with both this year's employment and last year's

## Conclusions about the profit-margin WEDGE

The profit-margin wedge extracted from the advertising/GDP ratio $R$ and the labor share $\lambda$ has low volatility and no apparent cyclical movements

The wedge is close to uncorrelated with both this year's employment and last year's

The evidence against a countercyclical profit-margin mechanism for cyclical movements of employment seems strong

# Conclusions about The Product-market WEDGE 

The product-market wedge $f$ is not correlated with current-year employment change, but is strongly correlated with previous-year employment change

## Conclusions about The product-market WEDGE

The product-market wedge $f$ is not correlated with current-year employment change, but is strongly correlated with previous-year employment change

The wedge's adverse effect operates not in the year of a recessionary employment contraction, but rather in the following year

## Conclusions about the product-market WEDGE

The product-market wedge $f$ is not correlated with current-year employment change, but is strongly correlated with previous-year employment change

The wedge's adverse effect operates not in the year of a recessionary employment contraction, but rather in the following year

The product-market wedge is responsible for the fall in the advertising/GDP ratio $R$ and for the decline in the labor share $\lambda$, in the aftermath of an employment contraction

## OTHER INFLUENCES

- A Hicks-neutral productivity index, $h$
- A labor wedge or measurement error, $f_{L}$
- A capital wedge or measurement error, $f_{K}$
- An advertising wedge or measurement error, $f_{A}$

## Model with other influences

$$
R=\frac{\kappa A}{p Q}=\frac{\alpha}{f_{A} f_{Q} m} \frac{(m-1) \epsilon+1}{\epsilon}
$$

## Model with other influences

$$
\begin{gathered}
R=\frac{\kappa A}{p Q}=\frac{\alpha}{f_{A} f_{Q} m} \frac{(m-1) \epsilon+1}{\epsilon} \\
\lambda=\frac{W}{p Q}=\frac{1}{f_{L} f_{Q} m} \gamma \frac{\epsilon-1}{\epsilon}
\end{gathered}
$$

## Conclusions

- The Hicks-neutral productivity index $h$ and the capital wedge or measurement error $f_{K}$ affect neither the advertising/sales ratio $R$ nor the labor share $\lambda$.
- The new wedge $f_{A}$ affects $R$ with an elasticity of -1 and the new wedge $f_{L}$ affects $\lambda$ with an elasticity of -1 ; the margin wedge $m$ remains the only wedge that has a high elasticity.
- The advertising wedge or measurement error, $f_{A}$, lowers $R$ in the same way that $f_{Q}$ does.
- The labor wedge or measurement error, $f_{L}$, lowers $\lambda$ in the same way that $f_{Q}$ does.
- Equal values of $f_{A}$ and $f_{L}$ have the same effect as $f_{Q}$ of the same value.

# Role of the two wedges in employment VOLATILITY 

$$
L_{t}=-\theta \log m_{t}-\delta \log f_{t}+x_{t}
$$

# Role of the two wedges in employment VOLATILITY 

$$
L_{t}=-\theta \log m_{t}-\delta \log f_{t}+x_{t}
$$

Prior: $\theta=\delta=1$

## Optimal PRICE

$$
\max _{p, A}\left(\frac{p}{f}-c\right) p^{-\epsilon} \bar{p}^{\bar{\epsilon}} A^{\alpha} \bar{A}^{-\bar{\alpha}}-\kappa A
$$

## Optimal PRICE

$$
\begin{gathered}
\max _{p, A}\left(\frac{p}{f}-c\right) p^{-\epsilon} \bar{p}^{\bar{\epsilon}} A^{\alpha} \bar{A}^{-\bar{\alpha}}-\kappa A \\
p^{*}=\frac{\epsilon}{\epsilon-1} f c
\end{gathered}
$$

## Profit-margin shock

$$
p=m p^{*}
$$

## Profit-margin shock

$$
\begin{gathered}
p=m p^{*} \\
p=m f \frac{\epsilon}{\epsilon-1} c
\end{gathered}
$$

## Optimal advertising

$$
\frac{\alpha}{A} Q\left(\frac{p}{f}-c\right)=\kappa
$$

## Optimal advertising

$$
\begin{gathered}
\frac{\alpha}{A} Q\left(\frac{p}{f}-c\right)=\kappa \\
\frac{\kappa A}{p Q}=\alpha \frac{p / f-c}{p}
\end{gathered}
$$

## Optimal advertising

$$
\begin{gathered}
\frac{\alpha}{A} Q\left(\frac{p}{f}-c\right)=\kappa \\
\frac{\kappa A}{p Q}=\alpha \frac{p / f-c}{p} \\
R=\frac{\kappa A}{p Q}=\alpha \frac{(m-1) \epsilon+1}{f m \epsilon}
\end{gathered}
$$

## Optimal advertising

$$
\begin{gathered}
\frac{\alpha}{A} Q\left(\frac{p}{f}-c\right)=\kappa \\
\frac{\kappa A}{p Q}=\alpha \frac{p / f-c}{p} \\
R=\frac{\kappa A}{p Q}=\alpha \frac{(m-1) \epsilon+1}{f m \epsilon} \\
\text { With } f=m=1, R=\frac{\alpha}{\epsilon}
\end{gathered}
$$

# LABOR SHARE 

$$
\lambda=\frac{W}{p Q}
$$

## LABOR SHARE

$$
\begin{gathered}
\lambda=\frac{W}{p Q} \\
\lambda=\frac{\gamma c Q}{p Q}=\gamma \frac{\epsilon-1}{\epsilon} \frac{1}{f m}
\end{gathered}
$$

## Implications of Alternative Values of the Residual Elasticity of Demand, with

$$
\theta=-1
$$

| Employment timing | Filter | Implied contributions of wedges to cyclical movements in the employment rate |  |  |  |  |  |
